

How much Seep Hose can be used with C12/24

You can put up to 6m of unregulated seep hose on to a C12/24. This is because pressure differences along the length will considerably affect how much water comes out as you get further from the inlet. Seep-hose lets water out too easily to be a good-self regulator.

If you are using drippers, you can add seep hose to as many or few as you wish as the dripper is regulating the output, the seep hose, with virtually zero pressure in it, is just spreading it out.

Current advice is you can put up to 1.2m of seep hose on a dripper, 2.4m with a dripper at each end - BUT, the amount of water emitted from a dripper depends on how many drippers are on the system, so above advice applies to 12 drippers, more than 12 drippers the lengths need to be reduced so that with 24 it is half the above advice. Note it is the total number of drippers which is important, not the number with seep hose attached.
